## Top O, Top X Software

Bowport Allroads Transport (BPA) commenced using the TopS software at the Macarthur Intermodal Shipping Terminal (MIST) in 2001 and it has become an integral part of our business.

This software enables BPA to quickly and efficiently manage its trucking fleet to best meet the clients needs. The design of pop-up prompts for critical checks on different job applications is paramount in efficient and correct job booking and truck allocations.

The data entry error rate and job duplications have been dramatically reduced by this software, by means of container number validation linked with job completion.

The speed of accessing data in our real-time process and over multiple users at the same time, is vital and very user friendly. The job booking screen gives the data entry person all the options they need on one screen and it is also linked to the clients rate card via the delivery address and any chargeable tick boxes on the screen.

The processing of additional transport legs for jobs is made easy with auto legging buttons (for those every day type jobs) thus reducing the key strokes required and also data entry errors.

The linking of the booking, tracking and costing programme to the terminal management software is seamless via truck and train arrivals and departures, which is linked to the job booking for both ease of data processing and error reduction.

Overall, we are very pleased with this product.
